AI/ML Engineer Intern

Company: Netly AI | **Location:** Remote | **Type:** Internship | **Deadline:** Ashoj 30, 2083

About Us & The Role

We are an early-stage startup focused entirely on pure R&D—no fancy website, no corporate fluff. Our **Computational Modelling Laboratory (CML)** builds lightweight AI models for fast, offline, **on-device Nepali translation** on standard mobile devices. This is a raw startup environment. We need an **entrepreneurial candidate** who loves taking absolute ownership and solving unstructured problems without hand-holding.

Key Responsibilities & What We Look For

You will build and optimize neural machine translation (NMT) models using compression techniques to run them offline on small devices. This requires cleaning large text datasets, training systems, and researching deployment solutions independently. To succeed, you need strong Python skills (NumPy, Pandas) and familiarity with PyTorch, TensorFlow, Hugging Face, or ONNX. You must be highly resourceful, comfortable with ambiguity, possess a good math foundation (linear algebra/statistics), and Bring Your Own Device (BYOD). Understanding Nepali grammar is a big plus.

What We Provide

We give you remote server access for heavy computational workloads and model training so you can work effectively on your own setup. Your code will directly shape our core technology from day one.

The first 1–3 months are an unpaid training period focused on learning NLP, model optimization, and core CML skills. Upon completion, top performers will transition into a **partially paid 6-month internship** or a permanent **full-time role** based on performance.

How to Apply

Email your resume and GitHub link to **info@netly.ai** before **Ashoj 30, 2083**.
